Please amend the Abstract on unnumbered page 25 to read as follows:

ABSTRACT

The present invention relates to a A method of multiplexing in a multiplexer a plurality of data streams to a single channel each of said the data streams containing a plurality of fixed length data packets being serially transmitted from a source to a destination by way of the data stream and the channel. [[,]] the The method comprising: includes for each data stream, receiving a data packet at an input of a data stream; segmenting the data packet into segments; and assigning a time label to the data packet, the time label containing data indicating an estimated arrival time for the packet at the multiplexer, transmitting. The time label is transmitted to the multiplexer at a first signal from the multiplexer, transmitting the segments eomprising having the data packet are transmitted to the channel at a second signal from the multiplexer; and storing the time label is stored as a previously transmitted stream time label; and for the multiplexer, signalling a data stream to transmit a time label by sending the first signal; receiving a received time label from a data stream, the received time label being associated with the data stream transmitting the received time label; storing the received time label in a group of received time labels the group of time labels containing received time labels from other data streams; sorting the group of received time labels to determine a transmitting time label with an earliest estimated arrival time of the group; sending a second signal to the data stream associated with the transmitting time label to transmit the segments comprising a transmitting data packet to the channel, said transmitting data packet being a data packet assigned with the transmitting time label; storing the transmitting time label as a previously transmitted channel time label; and removing eh transmitting time label from the group after the segments comprising the transmitting data packet have been transmitted.
